[#HydrogèneRenouvelable](#) | July 19, [FM Logistic](#) et [Bouygues Energies & Services](#) have officially launched the [#H2HUB](#) Loiret project, with the support of the Centre Val de Loire Region and the Métropole d'Orléans.

The opportunity to discuss the uses of hydrogen with our experts, to test on site a hydrogen vehicle and a MobHylPower hydrogen generator developed by PowiDian.

This unique project in France aims to decarbonize the logistics sector and expand uses by mobilizing many actors in the territory. A production of 800kg of renewable hydrogen per day will be gradually deployed on an FM Logistic site!

This hydrogen will be distributed via private and public stations deployed by our teams. This partnership is a first victory that will make it possible to supply hydrogen to an entire local ecosystem of public and private actors committed to the decarbonization of mobility at the scale of a territory! One more step in our commitment to a decarbonized future.
